

SRC-XX: Simple Title of Change Here

Change Description:

SM-01b A heatmap centered on trailhead locations, eventually weighted by a selectable pressure algorithm. Nearby busy trailheads merge into visible hotspots — the High Peaks cluster should light up.

This is the headline feature.

- Intensity should originally be derived from an absolute scale provided by the sponsor and evolve throughout the project lifecycle.
- Continuous spatial field - fades as the user zooms in, gives way to individual markers at closer zoom
- One approach that looks promising: Leaflet.heat - a lightweight plugin that accepts [lat, long, intensity] arrays and renders a smooth heatmap in the browser

As a stewardship manager, I want management areas shown as shaded zones at regional scale, so that I can see where visitor pressure is concentrated across the landscape before zooming in.

- Color or shade intensity reflects aggregate recent activity for that area
- No individual markers at this scale - the zone is the unit of information
- Hovering or tapping an area shows its name and a summary count

SM-01h The map should open showing the entire Adirondack Park (the "Blueline") and display the park boundary as a subtle reference layer.

- Data source: Adirondack Park Agency GIS — Adirondack Park Boundary Polygon
- I recommend downloading the boundary data and serving it as a static asset rather than depending on a live service — the APA GIS services can be unreliable.

SM-01c Management area zones (High Peaks Wilderness, Sentinel Range Wilderness, etc.) displayed as a subtle navigation layer — neutral fill, not data-driven.

- Data source: APA Land Classification layer (same APA GIS source)
- Same recommendation: download and serve as a static asset. The dataset is large and will likely need geometry simplification before use — mapshaper handles this well (~90% size reduction with negligible visual difference).

As a stewardship manager, I want selecting an area to highlight it on the map, zoom to its extent, and filter the graph to that area, so that I can move fluidly from spatial overview to data detail.

- Area highlight is subtle — distinguishable from the active state but not distracting
- Graph view automatically reflects the area selection; no additional configuration needed
- Deselecting returns to the full regional view

SM-01d Clicking a zone or choosing from the area menu highlights it, zooms to its extent, and filters the graph view to that area.

Write a 2-3 sentence minimum description of the change here. Try to answer the following questions: what problem exists with the current software? How does this solve that problem? What requirement (traced from the Requirements, Flow, and Use Case doc) is changing? OR What feature package (traced from the Feature Package doc) is being changed? What does the old behaviour look like, versus the new?

Change Level:

Feature Package

Change Type:

This is mostly constrained to requirement addition, change, or subtraction. But if some other term fits better, like “clarification” then that’s fine too.

Justification:

This is a justification for the change from either a technical or business perspective. This section should be the beefiest, as it’s the most important. You should try to answer questions like: Why is this the **best** solution? What alternate solutions were considered? What were the pros and cons of the alternatives? What thinking and process has been followed to come to your conclusion? What benefits does this solution bring? What tradeoffs are there for this solution? Why are the tradeoffs considered worthwhile? And so on. Any additional information can only be welcomed, as it will likely come up in the scope and requirements change request review.

From Craig: This will differentiate this product from other products that are on the market.

Impact:

This section is to be completed during the review meeting. It can have either (or both) a technical or business impact.

Requester: **Your Name**

Approver: **Approver Name (This depends on who requests change - can be team or sponsor. This just means everyone agrees to the change).**
