

# SRC-XX: Simple Title of Change Here

## Change Description:

Write a 2-3 sentence minimum description of the change here. Try to answer the following questions: what problem exists with the current software? How does this solve that problem? What requirement (traced from the Requirements, Flow, and Use Case doc) is changing? OR What feature package (traced from the Feature Package doc) is being changed? What does the old behaviour look like, versus the new?

## Change Level:

This notes the level of change. The different levels are Feature Package, Feature, Requirement, User Story, and Acceptance Criteria. It's understood that if multiple of a lower level change are occurring, such as multiple user stories, then the change level should be "requirement".

## Change Type:

This is mostly constrained to requirement addition, change, subtraction, or deployment. But if some other term fits better, like "clarification" then that's fine too.

## Justification:

This is a justification for the change from either a technical or business perspective. This section should be the beefiest, as it's the most important. You should try to answer questions like: Why is this the **best** solution? What alternate solutions were considered? What were the pros and cons of the alternatives? What thinking and process has been followed to come to your conclusion? What benefits does this solution bring? What tradeoffs are there for this solution? Why are the tradeoffs considered worthwhile? And so on. Any additional information can only be welcomed, as it will likely come up in the scope and requirements change request review.

## Impact:

This section is to be completed during the review meeting. It can have either (or both) a technical or business impact.

Requester: **Your Name**

Approver: **Approver Name (This depends on who requests change - can be team or sponsor. This just means everyone agrees to the change).**
